1. Executive Summary

This document outlines the business and functional requirements for **Skydd**, a revolutionary mobile-first platform designed to redefine the personal insurance landscape in Nigeria. Skydd's core mission is to make insurance a desirable, intuitive, and integral part of personal financial planning by seamlessly blending **goal-oriented savings and investment** with a robust insurance backbone. The result is a transformation of the perception of insurance: from a necessary expense into a proactive tool for wealth creation and protection.

Skydd will function as an **insure-fintech super-app**. Users will be able to subscribe to a curated suite of eight personal insurance products, including Job Loss Insurance, Child Education Insurance, Health Insurance, Life and Permanent Disability Insurance, General Annuity Insurance, Motor Vehicle Insurance, Home Insurance, and Device Insurance. Each product is intrinsically linked to a savings goal. Our unique **insurance-backed savings model** guarantees that if a user passes away before their savings plan matures, the full target amount is still paid out to their beneficiary, providing unparalleled peace of mind. This model directly competes with and enhances the value proposition of popular savings apps like PiggyVest and Cowrywise.

The platform will operate on a **white-label, offline liaison model**, partnering with a select group of 3 to 4 leading insurance companies. Skydd will **own and manage the entire product catalogue** in its backend admin panel. Participating underwriters provide their product parameters, pricing, and terms via a standardised Skydd Product Template (a document, not an API). Skydd configures these products in its system, presents them to users in a unified, Skydd-branded experience, and closes the sale end-to-end. Upon purchase, the customer receives a **Skydd-issued temporary certificate** instantly. Skydd then passes the customer details and policy information to the underwriter offline (via email, portal, or shared dashboard) for formal registration. The underwriter issues the final certificate, which Skydd uploads to the customer's app. **No API integration with underwriters is required.** The same liaison model applies to claims: the customer submits via the app, Skydd forwards to the insurer, follows up, and updates the status on the app. The integration of **Embedly** for wallet and payment services provides the core fintech infrastructure, including Skydd-branded virtual and physical cards.

2. Business Objectives and Vision

Skydd's vision is to make insurance "sexy" and accessible to a new generation of Nigerians by aligning it with their aspirations. The goal is not merely to sell insurance policies but to help people build wealth, protect their families, and achieve life milestones, with insurance as the invisible safety net that guarantees the outcome.

Primary Goal: To become the leading insure-fintech platform in Nigeria by offering innovative, goal-oriented, insurance-backed savings and investment products.

Strategic Objective	Description
Demystify Insurance	Reframe insurance as a positive, proactive financial tool for achieving life goals such as education, homeownership, and retirement, rather than a grudge purchase.
Enhance Value Proposition	Offer a superior alternative to traditional savings apps by integrating a life insurance guarantee into every savings plan. If the saver dies, the full target is still paid out.
Control the Customer Journey	Provide a seamless, end-to-end digital experience from product discovery and onboarding to certificate issuance, abstracting the complexity of the underlying underwriter.
Build Trust	Ensure full regulatory compliance with NAICOM and NDPR, and partner with reputable underwriters and financial service providers to build a trusted, secure platform.
Enable Financial Inclusion	Provide a digital wallet and Skydd card via Embedly, allowing users to save, pay premiums, and receive claim payouts all within a single ecosystem.
Operate Lean	Adopt an offline liaison model with underwriters that eliminates the dependency on insurer API readiness, allowing Skydd to launch faster and onboard partners with minimal technical friction.

3. Product Offerings: Insurance-Backed Savings

Skydd will launch with eight core product lines. Each is designed around a specific life goal and underpinned by the insurance-backed savings model. The fundamental principle is that every savings plan carries an insurance component: if the policyholder dies or becomes permanently disabled before the plan matures, the full target amount is guaranteed to the beneficiary.

No.	Product Line	Core Value Proposition	Target Audience
1	**Job Loss Insurance**	Provides a predetermined monthly income stream (e.g., 60% of salary) for a set period (e.g., 6 months) in case of involuntary job loss, protecting the user's savings and lifestyle.	Salaried professionals, gig economy workers
2	**Child Education Insurance**	A disciplined savings plan for a child's future education. Parents of newborns can buy a plan on day one that guarantees a fixed sum on a due date. If the parent passes away, the full education fund goal is guaranteed.	New parents, families with young children
3	**Life and Permanent Disability**	A pure protection product combined with a long-term savings component (endowment). Pays out the sum assured on death, permanent disability, or at maturity, whichever comes first.	All adults, primary income earners
4	**General Annuity Insurance**	A retirement savings plan that converts accumulated savings into a guaranteed regular income stream for life post-retirement. Users contribute monthly and receive annuity payouts upon reaching retirement age.	Individuals planning for retirement
5	**Motor Vehicle Insurance**	Comprehensive and third-party motor insurance with the option to add a savings component for future vehicle upgrades or maintenance funds.	Vehicle owners
6	**Home Insurance**	Protects property and contents against fire, flood, theft, and other perils, with an optional savings plan for future home improvements or mortgage down payments.	Homeowners, renters
7	**Health Insurance**	Provides access to quality healthcare through HMO and indemnity plans. Covers outpatient, inpatient, dental, optical, and maternity care. Can be bundled with a wellness savings component for out-of-pocket medical expenses.	Individuals, families, and SME employees
8	**Device Insurance**	Protects smartphones, laptops, and other gadgets against screen damage, theft, and accidental damage, with a savings goal for the next device upgrade.	All smartphone and gadget owners

4. Proposed User Journeys

The following sections detail the proposed end-to-end user journey for each of the eight product lines. Every journey follows a consistent pattern: **Discovery, Goal Setting, Plan Selection (white-label), Onboarding (KYC), Payment, Temporary Certificate Issuance, and Post-Sale Management.** The underwriter is only revealed on the temporary certificate. In the background, Skydd's operations team passes the customer details to the underwriter offline for formal registration. The final underwriter certificate is uploaded to the customer's app once received. No API integration with underwriters is involved at any stage.

4.1. Child Education Insurance

This is the flagship product, designed for parents of newborns who want to guarantee a fixed education fund on a specific date, regardless of what happens to them.

Step	User Action	Skydd Platform Action
1. Discovery and Goal Setting	User selects "Child Education" from the product catalogue. Enters child's name, date of birth, target education fund (e.g., ₦10,000,000), and desired maturity date (e.g., 18 years from now).	The Savings and Investment Calculator computes the required monthly premium based on the goal, tenure, and projected interest rate. Displays total contributions versus projected maturity value. Shows the guaranteed life insurance sum assured (equal to the target fund).
2. Plan Selection (White-Label)	The app presents 2 to 3 plan variations (e.g., Standard, Plus, Premium) with slightly different features, returns, or premium amounts. User selects the plan that fits best.	The White-Label Product Engine pulls pre-configured plans from the Skydd admin catalogue. Plans are rendered in a standardised Skydd UI with no underwriter branding visible. Each plan is tagged internally to its source underwriter.
3. Onboarding (KYC)	User fills in personal details: full name, date of birth, BVN or NIN, phone number, email, and beneficiary details. Uploads a valid ID if required for the plan value.	The KYC Module collects user data. BVN/NIN is verified in real-time via Embedly API. User information is securely stored and encrypted.
4. Payment	User chooses a payment method: Skydd Wallet, debit card (via Paystack), or bank transfer. Authorises the first premium payment. Optionally	The Payments Module integrates with Embedly to debit the Skydd Wallet or with Paystack to process card/bank payments. A recurring payment schedule is created and

	sets up auto-debit for recurring payments.	stored.
5. Temporary Certificate	Upon successful payment, the user instantly receives a **Skydd-branded temporary insurance certificate** in their app dashboard and via email. The certificate states the underwriter name.	The Policy Engine generates a unique Skydd policy number and a temporary certificate (PDF). The certificate states the sum assured, premium schedule, maturity date, and the underwriter name (e.g., "Underwritten by Leadway Assurance Plc"). The policy appears in the user's **Policy History**.
6. Offline Registration	User manages their plan entirely within the Skydd app: views savings balance, tracks progress toward the goal, and receives milestone notifications via **in-app notifications**.	Skydd's operations team exports the customer details and policy data and sends them to the underwriter via email or the insurer's portal. The underwriter registers the policy and issues the final certificate. Skydd uploads the final certificate to the user's **Document Vault** and sends an in-app notification: "Your final certificate from [Underwriter] is now available."

4.2. Job Loss Insurance

This product provides income protection in the event of involuntary job loss. It is a pure insurance product without a savings component.

Step	User Action	Skydd Platform Action
1. Eligibility and Quoting	User selects "Job Loss Insurance." Enters current monthly salary, employment type (full-time, contract), and industry sector.	The Quotation Engine calculates the premium for a standard cover (e.g., 60% of salary paid monthly for 6 months). Presents the quote with clear terms and a waiting period (typically 90 days).
2. Plan Selection	The app presents 2 to 3 anonymised plans with varying cover percentages (50%, 60%, 70%) and durations (3, 6, 12 months). User selects the preferred plan.	The White-Label Product Engine serves the available plans from the Skydd admin catalogue in Skydd branding.
3. Onboarding	User fills in employment details: employer name, employer address, employment start date, job title, and HR contact.	The KYC Module collects and securely stores employment and personal information. Verifies

	Provides personal KYC details.	identity via Embedly.
4. Payment and Temporary Certificate	User pays the first premium. Instantly receives the **Skydd-branded temporary certificate** with the underwriter name disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate. Skydd operations team forwards details to the underwriter offline for registration. In-app notification confirms purchase.
5. Claim Process	In the event of involuntary job loss, user opens the app, selects "Make a Claim," and uploads required documents: termination letter, final payslip, and employer confirmation.	The Claims Module provides a simple interface for claim submission. Skydd's operations team forwards the claim documents to the underwriter, follows up on processing, and updates the claim status on the app. Monthly payouts are made to the user's Skydd Wallet. User receives in-app notifications at each status change.

4.3. Motor Vehicle Insurance

Motor insurance is a mandatory product in Nigeria. Skydd will offer both comprehensive and third-party options, with an optional savings add-on for vehicle upgrades.

Step	User Action	Skydd Platform Action
1. Vehicle Details	User selects "Motor Vehicle Insurance." Enters vehicle details: make, model, year, plate number (or scans it via camera), and vehicle value.	The app uses OCR/camera to scan the plate number. The Quotation Engine calculates premiums for comprehensive and third-party options based on vehicle value and type.
2. Plan Selection	The app presents 2 to 3 anonymised plans for each cover type from the Skydd catalogue. User selects the preferred plan.	The White-Label Product Engine serves motor insurance plans from the admin catalogue. Plans include details on excess amounts, covered perils, and any add-ons (e.g., roadside assistance).
3. Onboarding	User provides personal details, driver's licence information, and vehicle registration documents.	The KYC Module collects and verifies all information. Vehicle details are validated.
4. Payment and Temporary	User pays the annual or monthly premium. Receives the **Skydd-branded temporary motor**	The Policy Engine generates the temporary certificate and motor insurance sticker. Skydd operations

Certificate	**insurance certificate** and digital sticker with underwriter disclosed. Policy appears in **Policy History**.	forwards details to the underwriter offline. In-app notification confirms purchase.
5. Claims	In the event of an accident or theft, user opens the app, selects "Make a Claim," uploads photos of the damage and a police report if applicable.	The Claims Module guides the user through the claim process with a step-by-step checklist. Skydd operations forwards the claim to the underwriter, coordinates assessment, and updates the claim status on the app via in-app notifications.

4.4. Life and Permanent Disability Insurance

This is an endowment-style product that combines life cover with a disciplined savings plan. It pays out on death, permanent disability, or at the end of the policy term.

Step	User Action	Skydd Platform Action
1. Goal Setting	User selects "Life and Permanent Disability." Enters desired sum assured (e.g., ₦20,000,000), policy term (e.g., 20 years), and beneficiary details.	The Savings Calculator computes the monthly premium that includes both the insurance cost and the savings component. Displays the projected maturity value.
2. Plan Selection	The app presents 2 to 3 anonymised endowment plans with varying returns and premium levels. User selects the preferred plan.	The White-Label Engine serves endowment plans from the Skydd admin catalogue in Skydd branding.
3. Onboarding	User provides full personal and medical details. May be required to complete a health questionnaire or medical examination for high sum assured amounts.	The KYC Module collects all information. For high-value policies, the app facilitates scheduling of a medical examination with a partner clinic.
4. Payment and Temporary Certificate	User pays the first premium and receives the **Skydd-branded temporary certificate** with underwriter disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate. Skydd operations forwards details to the underwriter offline. In-app notification confirms purchase.
5. Ongoing Management	User tracks savings growth, views projected maturity value, and can make additional voluntary	The app provides a dashboard showing savings progress, insurance cover status, and

	contributions. Receives milestone notifications.	projected returns. Sends in-app notifications at milestones (e.g., "You've reached 25% of your goal!"). The final underwriter certificate is uploaded to the Document Vault when received.

4.5. General Annuity Insurance

The annuity product is designed for retirement planning. Users contribute regularly and, upon reaching retirement age, convert their accumulated fund into a guaranteed regular income for life.

Step	User Action	Skydd Platform Action
1. Retirement Planning	User selects "General Annuity." Enters current age, desired retirement age, target monthly retirement income, and any existing retirement savings.	The Savings Calculator computes the required monthly contribution to achieve the target retirement income, factoring in projected investment returns and annuity rates.
2. Plan Selection	The app presents 2 to 3 anonymised annuity plans with varying projected returns and guaranteed income levels. User selects the preferred plan.	The White-Label Engine serves annuity plans from the Skydd admin catalogue.
3. Onboarding	User provides personal details, employment information, and existing pension details if applicable.	The KYC Module collects and verifies all information.
4. Payment and Temporary Certificate	User pays the first contribution and receives the **Skydd-branded temporary annuity certificate** with underwriter disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate. Skydd operations forwards details to the underwriter offline. In-app notification confirms purchase.
5. Accumulation Phase	User tracks fund growth over the years, can adjust contributions, and receives annual statements and milestone notifications.	The app provides a retirement dashboard showing fund value, projected retirement income, and progress toward the goal. Sends in-app notifications for annual statements and milestones.
6. Payout Phase	Upon reaching retirement age, user initiates the annuity payout. Receives regular monthly	Skydd operations coordinates with the underwriter to initiate annuity payouts. Payments are deposited into the user's Skydd Wallet or bank

	income into their Skydd Wallet.	account. User receives in-app notification for each payout.

4.6. Home Insurance

Home insurance protects the user's property and contents. The optional savings add-on allows users to build a fund for home improvements or a future down payment.

Step	User Action	Skydd Platform Action
1. Property Details	User selects "Home Insurance." Enters property type (owned/rented), address, estimated property value, and contents value.	The Quotation Engine calculates premiums for building cover, contents cover, or combined cover based on the property details and location risk profile.
2. Plan Selection	The app presents 2 to 3 anonymised plans with varying cover levels and optional add-ons (e.g., flood cover, liability cover). User selects the preferred plan.	The White-Label Engine serves home insurance plans from the Skydd admin catalogue.
3. Onboarding	User provides personal details and property documentation (e.g., proof of ownership or tenancy agreement).	The KYC Module collects and verifies all information.
4. Payment and Temporary Certificate	User pays the premium and receives the **Skydd-branded temporary home insurance certificate** with underwriter disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate. Skydd operations forwards details to the underwriter offline. In-app notification confirms purchase.
5. Claims	In the event of damage or theft, user opens the app, documents the incident with photos and a description, and submits a claim.	The Claims Module guides the user through the process. Skydd operations forwards the claim to the underwriter, coordinates property assessment, and updates the claim status on the app via in-app notifications.

4.7. Health Insurance

Health insurance is a critical product that provides users with access to quality healthcare. Skydd will offer both HMO (Health Maintenance Organisation) plans

for managed care and indemnity plans for fee-for-service reimbursement. An optional wellness savings component allows users to build a fund for out-of-pocket medical expenses not covered by their plan.

Step	User Action	Skydd Platform Action
1. Needs Assessment	User selects "Health Insurance." Indicates coverage type: Individual, Family (spouse and children), or Group/SME. Selects preferred plan tier: Basic, Standard, or Comprehensive.	The Quotation Engine presents plan options based on coverage type and tier. Each tier details covered benefits: outpatient visits, inpatient hospitalisation, surgery, dental, optical, maternity, and annual limits.
2. Plan Selection (White-Label)	The app presents 2 to 3 anonymised health plans with varying hospital networks, benefit limits, and premiums. User selects the preferred plan.	The White-Label Product Engine pulls health plan templates from the Skydd admin catalogue. Plans are displayed in Skydd branding with a standardised benefit comparison table. Each plan is tagged internally to its source HMO/underwriter.
3. Hospital Network Review	User browses the list of hospitals and clinics in the selected plan's network. Can search by location to find nearby providers. Selects a primary care provider (PCP).	The app displays the partner HMO's hospital network (pre-loaded into the Skydd database from the underwriter's template). Allows the user to designate a primary care provider for managed care plans.
4. Onboarding (KYC)	User fills in personal and medical details: full name, date of birth, BVN or NIN, pre-existing conditions (if any), and dependent details for family plans.	The KYC Module collects user data. BVN/NIN is verified via Embedly. Pre-existing condition declarations are recorded and flagged per the plan's terms.
5. Payment and Temporary Certificate	User pays the premium (annual or quarterly). Receives the **Skydd-branded temporary health insurance certificate** and a **digital HMO ID card** with the HMO/underwriter name disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate and digital HMO ID card. Skydd operations forwards the enrollee details to the partner HMO/underwriter offline for registration. In-app notification confirms purchase.
6. Utilisation and Claims	For HMO plans, user visits a network hospital and presents their digital HMO ID. For indemnity plans, user pays out-of-pocket and submits receipts for reimbursement via the app.	For HMO plans, Skydd operations coordinates with the HMO to ensure the enrollee is registered and can access care. For indemnity plans, the Claims Module processes reimbursement requests. Skydd operations forwards claims to the insurer and

		updates status via in-app notifications. The app tracks utilisation history and remaining annual limits.

4.8. Device Insurance

Device insurance is a high-frequency, low-premium product designed to attract younger users to the Skydd platform and introduce them to the concept of insurance.

Step	User Action	Skydd Platform Action
1. Device Details	User selects "Device Insurance." Enters device type (smartphone, laptop, tablet), brand, model, purchase date, and device value. Optionally uploads proof of purchase.	The Quotation Engine calculates the premium based on device type, value, and age. Presents the quote.
2. Plan Selection	The app presents 2 to 3 anonymised plans covering different perils (screen damage only, accidental damage, theft). User selects the preferred plan.	The White-Label Engine serves device insurance plans from the Skydd admin catalogue.
3. Onboarding	User provides personal details and takes a photo of the device (for condition verification).	The KYC Module collects information. The device photo is stored as baseline evidence.
4. Payment and Temporary Certificate	User pays the premium (monthly or annual) and receives the **Skydd-branded temporary device insurance certificate** with underwriter disclosed. Policy appears in **Policy History**.	The Policy Engine processes payment, generates the temporary certificate. Skydd operations forwards details to the underwriter offline. In-app notification confirms purchase.
5. Claims	In the event of damage or theft, user opens the app, uploads photos of the damaged device or a police report for theft, and submits a claim.	The Claims Module processes the claim submission. Skydd operations forwards the claim to the underwriter, follows up, and updates the status via in-app notifications. For approved claims, the payout is deposited into the user's Skydd Wallet.

5. Functional Requirements

5.1. Savings and Investment Calculator

This is a **proprietary module** that Skydd must build in-house. It is the engine that powers the goal-oriented product design. Embedly provides only account and payment APIs; it does not offer savings calculators, interest computation, or goal-tracking functionality. Therefore, Skydd must develop this module from scratch.

Component	Details
Inputs	Target Amount (₦), Savings Duration (years or months), Initial Deposit (optional), Frequency (monthly, quarterly, annually), Risk Appetite (Low, Medium, High: for future investment products).
Core Logic	Calculates the required fixed periodic premium to reach the target amount based on a projected interest rate (compounded monthly). The life insurance component cost is bundled into this premium. Uses standard time-value-of-money formulas: FV = PMT x [((1+r)^n - 1) / r].
Output Display	A clear, visual breakdown: "To reach ₦10,000,000 in 18 years, you need to save ₦20,000 per month. Your total contribution will be ₦4,320,000, and we will grow it to ₦10,000,000 for you. This plan includes a ₦10,000,000 life insurance guarantee."
Progress Tracking	A dashboard that shows: current savings balance, total contributions to date, projected maturity value, insurance cover amount, and a visual progress bar toward the goal.
Projections	An interactive chart showing three scenarios (conservative, moderate, optimistic) based on different interest rate assumptions, so the user understands the range of outcomes.

5.2. White-Label Product Engine and Admin Catalogue

The White-Label Product Engine is the core system that enables Skydd to present insurance products from multiple underwriters in a unified, Skydd-branded experience. **Critically, this engine does not require any API connection to underwriters.** All product data is managed internally by Skydd's admin team via a backend admin panel.

Admin Product Catalogue: Skydd's admin team creates and manages all insurance products in a backend admin panel. For each product, the admin enters: product name, product type, underwriter name (hidden from users until certificate stage), premium rates (by age band, tenure, sum assured), terms and conditions, exclusions, waiting periods, benefit limits, and any supporting

documents. Products can be activated, deactivated, or updated at any time without any code changes.

Underwriter Onboarding Process: When a new underwriter partner is onboarded, Skydd sends them the **Skydd Product Template** (a standardised Word document) for each product they wish to offer. The underwriter fills in their pricing, terms, exclusions, and specimen documents. Skydd's admin team then enters this information into the backend admin panel. No technical integration is required from the underwriter.

Anonymised Presentation: When a user requests a quote, the Skydd backend pulls matching plans from the admin catalogue and presents them to the user in a uniform Skydd design. Plans are labelled as "Plan A," "Plan B," and "Plan C" rather than by underwriter name. The underwriter is only revealed on the temporary certificate after the user selects a plan and completes payment.

5.3. Fintech Module (Powered by Embedly)

The fintech module leverages Embedly's Banking-as-a-Service (BaaS) infrastructure to provide wallet and payment capabilities within the Skydd app.

Feature	Description	Embedly API
Skydd Wallet	Every user gets a digital wallet upon registration. Supports tiered KYC (Tier 1: ₦300,000 daily limit; Tier 2: ₦1,000,000; Tier 3: unlimited). Used for premium payments, claim payouts, and general transactions.	Open Wallet API
Skydd Card (Virtual)	Users can instantly generate a virtual Skydd-branded debit card linked to their wallet. Can be used for online purchases and ATM-less transactions.	Card Issuance API
Skydd Card (Physical)	Users can request a physical Skydd-branded card delivered to their address. PCI DSS certified. Supports ATM withdrawals and POS transactions.	Card Issuance API
Fund Wallet	Users can fund their wallet via bank transfer, card payment (Paystack), or USSD.	Open Wallet API + Paystack
Transfers and Payouts	Users can transfer funds from their Skydd Wallet to any Nigerian bank account. Claim payouts are deposited directly into the wallet.	Payout API
Card Management	Users can freeze/unfreeze their card, set spending limits, view transaction history, and block a lost card.	Card Management API

5.4. Policy and Certificate Engine

The Policy Engine is responsible for the end-to-end lifecycle of a policy within the Skydd platform. Upon successful payment, it generates a unique Skydd policy number and a **Skydd-branded temporary insurance certificate** in PDF format. The temporary certificate includes: policyholder name, product type, sum assured, premium amount and frequency, policy start and end dates, beneficiary details, and the underwriter name and licence number. This certificate serves as proof of cover while Skydd's operations team registers the policy with the underwriter offline.

Once the underwriter completes registration and issues the final certificate, Skydd's operations team uploads the final certificate to the customer's **Document Vault** within the app. The user receives an **in-app notification** informing them that their final certificate is available. The engine also manages renewals (with automated reminders), lapses, and cancellations.

5.5. Policy History and Document Vault

Every user has a dedicated **Policy History** screen within the app that provides a comprehensive view of all their insurance and savings plans. This is a critical feature for user engagement and trust.

Feature	Description
Policy List	A chronological list of all policies (active, expired, cancelled, and pending). Each entry shows: product type, plan name, status badge (Active, Pending Registration, Expired, Claimed), premium amount, and next payment date.
Policy Detail View	Tapping a policy opens a detailed view showing: full policy terms, sum assured, premium schedule, payment history, savings progress (for savings-linked products), beneficiary details, and the underwriter name.
Document Vault	A secure document repository for each policy. Contains: the Skydd temporary certificate (issued instantly at purchase), the final underwriter certificate (uploaded by Skydd operations once received), and any claim-related documents.
Payment History	A detailed log of all premium payments made for each policy, including date, amount, payment method, and transaction reference.
Renewal Reminders	Automated in-app and push notifications reminding users of upcoming policy renewals, with a one-tap renewal option.

5.6. In-App Notifications

The in-app notification system is a core engagement and communication tool within the Skydd app. It ensures users are always informed about the status of their policies, payments, claims, and savings goals.

Notification Type	Trigger	Example Message
Purchase Confirmation	User completes a policy purchase	"Your Child Education plan has been activated! Your temporary certificate is ready in your Policy History."
Final Certificate Ready	Skydd operations uploads the final underwriter certificate	"Great news! Your final certificate from Leadway Assurance is now available in your Document Vault."
Payment Reminder	3 days before a recurring premium is due	"Your monthly premium of ₦20,000 for your Child Education plan is due on March 15. Ensure your wallet is funded."
Payment Successful	A recurring or one-time payment is processed	"Payment of ₦20,000 received for your Child Education plan. Thank you!"
Payment Failed	A recurring payment fails (insufficient funds)	"Your premium payment of ₦20,000 failed. Please fund your wallet to avoid a policy lapse."
Savings Milestone	User reaches a savings milestone (25%, 50%, 75%)	"Congratulations! You have reached 50% of your ₦10,000,000 education fund goal!"
Claim Status Update	Skydd operations updates a claim status	"Your motor insurance claim has been approved. A payout of ₦500,000 has been deposited into your Skydd Wallet."
Policy Renewal	30 days before policy expiry	"Your Motor Vehicle Insurance expires on April 15. Renew now to maintain continuous cover."
Promotional	New product launch or special offer	"Introducing Device Insurance! Protect your smartphone from just ₦500/month."

5.7. Claims Management Module

The Claims Module provides a user-friendly interface for submitting and tracking insurance claims. Users can initiate a claim directly from their policy dashboard, upload supporting documents (photos, police reports, medical records, termination letters), and track the status of their claim in real-time. **Skydd acts as**

the full liaison between the customer and the underwriter. The customer never needs to contact the underwriter directly.

Claims Workflow: (1) Customer submits a claim via the app with all required documents. (2) Skydd's internal claims team reviews the submission for completeness. (3) Skydd forwards the claim package to the underwriter via email or their portal. (4) Skydd follows up with the underwriter on processing timelines. (5) Skydd updates the claim status on the app at each stage (Submitted, Under Review, Approved, Settled, or Rejected with reason). (6) The user receives an **in-app notification** at every status change. (7) Approved claim payouts are deposited directly into the user's Skydd Wallet.

6. Underwriter Partnership Model (Offline Liaison)

Skydd operates on an **offline liaison model** with its insurance underwriter partners. This means there is **no API integration** between Skydd and any underwriter. All communication and data exchange happens via email, shared dashboards, or the underwriter's existing portal. This approach eliminates the dependency on insurer API readiness, allows Skydd to launch faster, and enables partnerships with any insurer regardless of their technology maturity.

6.1. How the Offline Model Works

Stage	Skydd Action	Underwriter Action
1. Product Setup	Skydd sends the underwriter the Skydd Product Template (a standardised Word document) for each product they wish to offer. The underwriter fills in their pricing, terms, exclusions, and specimen documents.	The underwriter completes the template and returns it to Skydd along with specimen certificates, proposal forms, and claims forms.
2. Catalogue Configuration	Skydd's admin team enters the underwriter's product parameters into the Skydd backend admin panel. The product goes live on the app.	No action required from the underwriter.
3. Policy Sale	When a customer purchases a policy, Skydd issues a temporary certificate instantly. Skydd then exports the customer details and policy data (via CSV, email, or a shared Google Sheet/dashboard) and sends	The underwriter receives the customer details, registers the policy in their system, and issues the final certificate. They return the final certificate and their policy reference number to Skydd.

	them to the underwriter.	
4. Certificate Handover	Skydd uploads the final underwriter certificate to the customer's Document Vault in the app and sends an in-app notification.	No further action required.
5. Claims Liaison	When a customer submits a claim via the app, Skydd's operations team packages the claim documents and forwards them to the underwriter via email or portal. Skydd follows up regularly and updates the claim status on the app.	The underwriter processes the claim per their standard procedures and communicates the outcome to Skydd.
6. Reconciliation	Skydd provides the underwriter with a monthly reconciliation report of all policies sold, premiums collected, and claims submitted. Premiums are remitted to the underwriter per the agreed schedule.	The underwriter reconciles against their records and confirms. Commission payments are made to Skydd per the agreed structure.

6.2. What Skydd Needs from Each Underwriter

Requirement	Details
1. Completed Product Templates	For each product the underwriter wishes to offer through Skydd, they must complete and return the Skydd Product Template with all parameters: premium rates by age/tenure/sum assured, fees, exclusions, waiting periods, maturity terms, and benefit limits.
2. Specimen Documents	Sample policy wording documents, specimen proposal forms, specimen claims forms, and specimen certificates for each product.
3. Commission Structure	A clear, mutually agreed-upon commission rate for each policy sold through the Skydd platform. Per NAICOM guidelines, this must not exceed the stipulated rate for insurance intermediaries.
4. Service Level Agreement (SLA)	A comprehensive SLA covering: policy registration turnaround time (target: 48 hours), claims processing timelines, support escalation procedures, and data sharing protocols.
5. Designated Contact Person	A dedicated relationship manager or operations contact at the underwriter who will handle all Skydd policy registrations, claims, and queries.

6. Regulatory Documentation	The underwriter must be in good standing with NAICOM and provide: evidence of valid licence, evidence of adequate reinsurance, and board approval in support of the partnership with Skydd.

6.3. Recommended Underwriter Partners

Based on product alignment and market reputation, the following underwriters are recommended for partnership. Skydd should aim to onboard 3 to 4 of these to provide competitive plan options across all eight product lines.

Underwriter	Strengths	Recommended Products
Leadway Assurance	Strong in education savings, life, health, and general insurance. Market leader in endowment products.	Child Education, Life and Disability, Health Insurance, Home Insurance
AXA Mansard	Strong in health insurance (AXA Mansard Health), device insurance, motor, and life products.	Health Insurance, Device Insurance, Motor Vehicle, Life and Disability
Stanbic IBTC Insurance	Leader in annuity and retirement products under the Pension Reform Act. Strong investment management.	General Annuity, Child Education
Anchor Insurance	Pioneer in job loss insurance products in Nigeria. Established claims process for employment-related covers.	Job Loss Insurance
Cornerstone Insurance	Strong in gadget protection and general insurance. Competitive pricing.	Device Insurance, Home Insurance, Motor Vehicle
Hygeia HMO	One of Nigeria's leading HMOs with an extensive hospital network across all 36 states.	Health Insurance (HMO Plans)

7. Technical Architecture and Build Feasibility

The Skydd platform will be built as a modern, cloud-native application. The adoption of the offline liaison model with underwriters **significantly simplifies the technical architecture** by removing the need for complex, multi-party API

orchestration. The primary technical integrations are limited to Embedly (fintech) and Paystack (payments).

Layer	Technology	Purpose
Mobile Frontend	React Native with Expo	Cross-platform mobile app for iOS and Android with a single codebase.
Backend API	Node.js or Python (FastAPI)	RESTful API server handling business logic, user management, and third-party integrations.
Admin Panel	React Web App	Backend admin panel for Skydd operations team to manage the product catalogue, upload final certificates, update claim statuses, and view reports.
Database	PostgreSQL + Redis	Primary relational database for users, policies, products, and transactions. Redis for caching and session management.
BaaS Provider	Embedly	Wallet creation, card issuance, KYC verification, and payout services.
Payment Gateway	Paystack	Card payment processing, bank transfers, and recurring billing.
Custom Modules	Savings Calculator, White-Label Engine, Policy Engine, Claims Module, Notification Engine	Proprietary business logic built in-house by Skydd.
Cloud Infrastructure	AWS or Google Cloud	Hosting, storage, CDN, and security infrastructure.
Notifications	Firebase Cloud Messaging + In-App + Email (SendGrid)	Push notifications, in-app notification centre, SMS alerts, and email communications.

Build Feasibility Assessment: The offline liaison model makes this project significantly more feasible as a custom build. The removal of underwriter API dependencies means the entire platform can be built, tested, and launched without waiting for any insurance company to develop or expose APIs.

Component	Can Manus Build It?	Notes
Frontend (React Native)	Yes	Full UI with all screens, navigation, animations, policy history, and in-app notifications.

Backend API	Yes	Complete API server with authentication, business logic, and database integration.
Admin Panel	Yes	Web-based admin panel for product catalogue management, certificate uploads, and claim status updates.
Savings Calculator	Yes	Custom financial calculation engine with time-value-of-money formulas.
White-Label Engine	Yes	Admin-managed product catalogue with anonymised plan presentation.
Policy and Certificate Engine	Yes	PDF generation for temporary certificates, policy numbering, and lifecycle management.
Policy History and Document Vault	Yes	Full policy history screen with document storage and retrieval.
In-App Notification System	Yes	Notification centre with push notifications via Firebase and in-app message list.
Claims Module	Yes	Document upload, status tracking, and workflow management with admin-side status updates.
Embedly Integration	Yes	API integration for wallets, cards, and payouts (requires Embedly API keys).
Paystack Integration	Yes	Payment processing and recurring billing (requires Paystack API keys).
Underwriter Integration	Not Needed	No API integration required. All underwriter communication is handled offline by Skydd operations.
Native Mobile App (APK/IPA)	No	I can write all the code, but compiling to APK/IPA requires a local development environment with Android Studio or Xcode.

Can App Gen build this? No. App Gen tools are designed for simpler applications with standard CRUD operations. A project of this complexity, with its multi-product insurance marketplace, proprietary savings calculator, white-label product engine, admin panel, policy history, in-app notification system, deep fintech integrations (Embedly, Paystack), and regulatory compliance requirements (NAICOM, NDPR), requires a custom, hands-on build with careful, feature-by-feature development and testing.

8. Regulatory and Compliance Framework

Skydd will operate as a **"Partnering Insurtech"** under the NAICOM Guidelines for Insurtech Operations in Nigeria (August 2025). This classification applies to technology companies that partner with licensed insurance institutions to distribute and manage insurance products digitally.

Requirement	Details
Minimum Capital	As a Partnering Insurtech, Skydd must maintain a minimum capital of ₦10,000,000.
NAICOM Registration	Skydd must complete the three-stage registration process: Application, Verification, and Licensing. This includes submitting SLAs with partner underwriters, organisational charts, IT infrastructure details, and a five-year financial projection.
SLA with Underwriters	Formal Service Level Agreements must be executed with each insurance underwriter partner and submitted to NAICOM. The SLA must cover scope of operations, duties, data sharing, and regulatory compliance responsibilities.
Senior Officers	Skydd must employ a senior officer for insurance operations (minimum 5 years experience, insurance qualification) and a senior officer for technology operations (computer science degree or equivalent). Both appointments are subject to NAICOM approval.
Data Privacy (NDPR)	Strict adherence to the Nigeria Data Protection Regulation is required. User data will only be transmitted to the underwriter after a policy is purchased and with explicit user consent. An annual technology audit by an independent firm is mandatory.
Premium Handling	In line with Section 50(1) of the Insurance Act 2003, premium payment is a condition precedent to a valid contract. Skydd will ensure premiums are collected before cover is confirmed and remitted promptly to the underwriter.
Lead Management System	Skydd must deploy a Lead Management System (LMS) to record all user visits, leads, and preferences. LMS data may only be shared with partner underwriters and NAICOM.
